Ex. No : 06 App Navigation Aim

To understand navigation between multiple screens in an Android application using explicit intents.

Procedure

1. Open Android Studio.
2. Create a new project (Empty Activity, Kotlin).
3. Design the main screen with:

O Background image O

Buttons (Home, Next, Back)

1. Create additional activities (SecondActivity / HomeActivity if needed).
2. Design layouts for each activity.
3. Use **Intent** to navigate between activities.
4. Run the app and test navigation using buttons.

Code activity_main.xml (UI similar to your image)

```
<?xml version="1.0" encoding="utf-8"?>
<RelativeLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:layout_width="match_parent"
    android:layout_height="match_parent">

    <!-- Background Image -->
    <ImageView
        android:layout_width="match_parent"
        android:layout_height="match_parent"
        android:src="@drawable/bg_space"
        android:scaleType="centerCrop"/>

    <!-- Buttons --> <LinearLayout
        android:layout_width="match_parent"
        android:layout_height="wrap_content"
        android:layout_alignParentBottom="true"
        android:gravity="center"
        android:orientation="horizontal"
        android:padding="16dp">

        <Button
            android:id="@+id/btnBack"
            android:text="Back"/>
        <Button
            android:id="@+id/btnHome"
            android:text="Home"
```

```

        android:layout_margin="10dp"/>

        <Button
        android:id="@+id/btnNext"
        android:text="Next"/>
    </LinearLayout>

</RelativeLayout>

```

MainActivity.kt

```

package com.example.appnavigationdemo

import android.content.Intent
import android.os.Bundle import
android.widget.Button
import androidx.appcompat.app.AppCompatActivity

class MainActivity : AppCompatActivity() {

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContentView(R.layout.activity_main)

        val btnNext =
            findViewById<Button>(R.id.btnNext) val btnHome =
            findViewById<Button>(R.id.btnHome)

        btnNext.setOnClickListener {
            startActivity(Intent(this, SecondActivity::class.java))
        }

        btnHome.setOnClickListener {
            startActivity(Intent(this, MainActivity::class.java))
        }
    }
}

```

SecondActivity.kt

```

package com.example.appnavigationdemo

import android.os.Bundle
import androidx.appcompat.app.AppCompatActivity

```

```
class SecondActivity : AppCompatActivity() {  
  
    override fun onCreate(savedInstanceState: Bundle?) {  
        super.onCreate(savedInstanceState)  
        setContentView(R.layout.activity_second)  
    }  
}
```

activity_second.xml

```
<?xml version="1.0" encoding="utf-8"?>  
<LinearLayout  
    xmlns:android="http://schemas.android.com/apk/res/android"  
    android:gravity="center" android:orientation="vertical"  
        android:layout_width="match_parent"  
        android:layout_height="match_parent">  
  
        <TextView  
            android:text="Welcome to Second Activity"  
            android:textSize="22sp"/> </LinearLayout>
```

Result

The application successfully:

- Displays a styled main screen
- Navigates between activities using buttons
- Demonstrates the use of **explicit intents**
